Groundwater Resource Hub

Groundwater Dependent Ecosystems are a required element of Groundwater Sustainability Plans. Until now, there has not been a systematic approach or understanding of how to address GDEs in GSPs.

The Nature Conservancy in California has worked with the water community to create a time and money saving resource that you can use in managing your groundwater sustainably. This resource will give you the information and tools you can use to create a localized, systematic and defensible framework for including GDEs as you create GSPs.

To use these tools as you pursue sustainable groundwater management and to learn more, go to:

groundwaterresourcethub.org
